Catalog No. 70-120

Anti-MCM7 antibody, rabbit polyclonal IgG

Key words: DNA replication licensing factor, MCM complex, DNA replication initiation, G1/S transition, DNA damage response, DNA helicase,

Function: MCM7 (human; 718 aa, 80 kDa) acts as component of the MCM2-7 complex (MCM complex) which is the putative replicative helicase essential for 'once per cell cycle' DNA replication initiation and elongation in eukaryotic cells. The active ATPase sites in the MCM2-7 ring are formed through the interaction surfaces of two neighboring subunits such that a critical structure of a conserved arginine finger motif is provided in trans relative to the ATP-binding site of the Walker A box of the adjacent subunit. The six ATPase active sites, however, are likely to contribute differentially to the complex helicase activity. Required for S-phase checkpoint activation upon UV-induced damage.

Applications

1) Western blotting (1/1,000~1/5,000 dilution).
2) Immunoprecipitation (assay dependent)
3) Immunofluorescence staining (1/200~1/1,000 dilution).

Other applications have not been tested.

Immunogen: Purified His6-tagged human MCM7 protein encompassing 562 -719 amino acids.

Reactivity: Reacts with human mouse, rat and hamster. Not tested in other species.

Product: Purified IgG from the rabbit antiserum. 1 mg/ml in PBS, 50% glycerol, filter-sterilized. Azide- and carrier-free.

Size: 100 ug

Storage: Shipped at 4℃. Upon arrival, spin-down, aliquot and store at -20℃.

Data Link UniProtKB/Swiss-Prot P33993 MCM7_HUMAN
