\mathbf{N} -Histofine[®]

Simple Stain Mouse MAX PO (R)

Universal Immuno-peroxidase Polymer for Mouse tissue sections Anti- Rabbit primary antibody

M -Histofine [®] Immunohistochemical staining reagent		Store at 2-8°C
Reagents supplied: 17mL x 1 bottle	e (170 tests)	Code : 414341F

Made in Japan

NICHIREI BIOSCIENCES INC.

1. INTRODUCTION

NICHIREI BIOSCIENCES developed a unique immunohistochemical staining system called Universal Immuno-enzyme Polymer (UIP) method (US Patent No.6.252,053). This is NICHIREI BIOSCIENCES's original technique. **M**-Histofine[®] Simple Stain Mouse MAX PO (R), this provides both high sensitivity and time saving in immunohistochemical applications.

2. PRESENTATION

Liquid. Ready to use.

M -Histofine[®] Simple Stain Mouse MAX PO (R) (Universal Immuno-peroxidase Polymer for mouse tissue sections. Anti-Rabbit primary antibody) is the labeled polymer prepared by combining amino acid polymers with peroxidase and goat anti- Rabbit Ig which are reduced to Fab. It is stored in MOPS (3-Morpholinopropanesulfonic acid) buffer (pH 6.5) containing stabilizer and antibacterial agent.

Description of **M**-Histofine[®] Simple Stain Mouse MAX PO (R) (Universal Immuno-peroxidase Polymer for mouse tissue sections. Anti- Rabbit primary antibodv

IgG fraction purified from immunized goat serum is digested to prepare F(ab')2. Antigen-specific F(ab')2 is affinity-purified with the antigen. Solid-phase absorption is carried out with mouse serum. Peroxidase-labeled amino acid polymer is conjugated to Fab' obtained by reducing $F(ab')_2$.

3. INTENDED USE

FOR RESEARCH USE ONLY.

M-Histofine[®] Simple Stain Mouse MAX PO (R) is designed to allow immunohistochemical studies using a user-supplied rabbit primary antibody. This reagent is basically available for formalin-fixed paraffin-embedded mouse tissue sections. Please contact NICHIREI BIOSCIENCES technical service department concerning this reagent for other specimens

4. PRINCIPLE

The antigen / antibody / Universal Immuno-peroxidase Polymer for mouse tissues complex can be prepared by allowing the reagent to react with a rabbit primary antibody bound to the antigen on mouse tissue section. The enzymatic activity of this complex results in a colored deposit, thus staining the antigen site.

5. PRECAUTION WHILE USING OR HANDLING.

- Before using this reagent, please read these instructions. 1
- 2. Do not use reagents after the expiration date.
- Specimens, before and after fixation, and all other materials exposed to them. should be handled like biohazardous materials with proper precautions.
- 4. Inhalation or ingestion of the highly allergic fixative formaldehyde is harmful. Wear protective mask. If swallowed, induce vomiting. If skin or eye contact occurs, wash thoroughly with water.
- 5. Organic reagents are flammable. Do not use near open flame.
- 6. Never pipette reagents by mouth and avoid their contact with skin, mucous membranes and clothes.

٠

٠

- 7. Avoid microbial contamination of reagents as incorrect result may occur.
- 8. Avoid splashing of reagents or generation of aerosols.
- 9 For research use only. Not for diagnostic use.

6. STAINING PROCEDURES

- Reagents and Materials required but not provided Negative control reagent
- Rabbit primary antibody
- Xylene •
- 100% ethanol

•

- 95% ethanol
- Counter staining solution
- 3% solution of hydrogen peroxide in absolute methanol (Add 1 part of ٠ 30% hydrogen peroxide to 9 parts of • ٠
- absolute methanol) Phosphate buffered saline (PBS) $(pH^{7.6}\pm 0.2)$
 - NaCl
 - 7.75 g 1.50 g K₂HPO₄
 - KH₂PO₄
 - distilled water 1L
- Adhesive for tissue section (0.02% poly-L-lysin, silane or the like) •
- Chromogen/substrate reagent
- *M***-Histofine**[®] Simple Stain AEC solution (No preparation, One-bottle)
 - 500 tests Code: 415182F

Code: 415184F 1500 tests

NICHIREI BIOSCIENCES developed One-bottle, ready to use and no preparation chromogen/substrate called **M**-Histofine[®] Simple Stain Substrate Solution.

Specimen preparation

[Paraffin-embedded mouse tissue sections]

Specimens may undergo histological disintegration or antigenic denaturation when subjected to highly concentrated fixative or prolonged fixing. Thus, in order to obtain an optimal fixing, maintaining tissue morphology and antigen activity, tissues which are as fresh as possible and small in size (about 1cm x 1cm x 0.5cm) should be used. The fixatives as shown below are recommended.

Fixing reagent	Fixing time
10% formalin or buffered formalin	24-48 hours
20% formalin	12-24 hours

Section preparation

[Paraffin-embedded mouse tissue sections]

The cut sections should be 3-6 µm and placed on slides. When further treatments are to be done such as Antigen Recovery, Heat-Induced Epitope Retrieval (HIER) or trypsin treatment, the glass slides should be coated with an adhesive like 0.02% poly-L-lysin or silane for tissue sections.

[Control slides]

A positive control slide, negative control slide and reagent control slide are needed and processed in the same way as the unknown specimen slide to interpret staining results.

- Deparaffinization and Rehydration
- 1. Treatment with xvlene
- (1) Immerse the slides in xylene. After 3 minutes, take out and shake off the excessive xylene in the slides.
- (2) 2. Repeat 1.(1) twice using fresh xylene.
- Treatment with ethanol
- (1) Immerse slides in 100% ethanol. After 3 minutes, take out and shake off the excessive 100% ethanol in the slides.
- (2) Repeat 2.(1) once with fresh 100% ethanol.
- (3) Then, treat them twice with 95% ethanol in the same way as described above
- 3. Washing

After excessive ethanol is shaken off, immerse slides in PBS for 5 minutes.

- Recommended Staining Procedures
- Ouenching of endogenous peroxidase 1.
- Wipe areas around the sections on the slides carefully to remove excess (1)solution.
- (2)Immerse them in 3% solution of hydrogen peroxide in absolute methanol for 10-15 minutes at room temperature.
- Rinse them in fresh PBS for 3 times, each of 5 minutes duration. (3)
- 2. Addition and reaction of the primary antibody
- Wipe areas around the sections on the slides carefully. (1)
- Apply 2 drops of primary antibody to specimen slide, positive control slide (2)and negative control slide respectively so as to provide a complete cover of the sections.
- (3) To the reagent control slide, apply two drops of negative control reagent (normal serum) in place of primary antibody.
- Incubate them at room temperature or 4°C. (Follow the instructions for (4)incubation time data designated in the package insert of primary antibody)
- Rinse them in fresh PBS for 3 times, each of 5 minutes duration. (5)
- Addition and reaction of **M-Histofine**[®] Simple Stain Mouse MAX PO 3. (R) (Universal Immuno-peroxidase Polymer for mouse tissue sections. Anti-Rabbit primary antibody).
- Wipe areas around the sections on the slides carefully.
- (2)Apply 2 drops of Simple Stain Mouse MAX PO (Ř) to each slide so as to provide a complete cover of the sections. Incubate at room temperature for 30 minutes.
- (3) Rinse them in fresh PBS for 3 times, each of 5 minutes duration.
- 4. Addition and reaction of chromogen/substrate reagent
- (1) Wipe areas around the sections on the slides carefully.
- (2)Apply 2 drops of the chromogen/substrate reagent to each slide so as to provide a complete cover of the sections. Incubate at room temperature for 5-20 minutes.
- (3) Rinse them in distilled water for 3 times, each of 5 minutes duration.
- 5. Counter-staining
- Immerse them in the counterstain solution. (1)
- (2)Wash them well with tap water.
- 6. Mounting

In case of alcohol soluble substrates like AEC, the tissue sections are mounted with water-based mounting media without further treatment. In case of alcohol insoluble substrates like DAB, they are mounted with permanent mounting media after washing with water, dehydrated in graded series of alcohol and cleared in xylene.

- 0.20 g

■ Interpretation of results

1. Microscopic observation

The slides are examined under a light microscope for a positive reaction. It is necessary to make comparison with three types of the control slides for interpreting staining results.

- Positive control slide
 A specimen containing the target antigen which is processed in the same way
 as the unknown specimen.
- Negative control slide A specimen not containing the target antigen which is processed in the same way as the unknown specimen.
- Reagent control slide

The control specimen is used and processed in the same way as the test specimen except that negative control reagent is used instead of primary antibody. If the slide is stained, it is probably due to non-specific reaction by non-specific protein binding.

7. STORAGE

Store in a dark place at 2-8°C.

8. TROUBLE SHOOTING

9. LIMITATION

Tissue staining is dependent on the handling and processing of the tissue prior to staining. Improper fixation, freezing, thawing, washing, drying, heating, or sectioning may produce artifacts or false-negative results.

Results will not be optimal if old or unbuffered fixatives are used, or excessively heated during embedding or during attachment of sections to slides.

False-positive results may be seen due to nonspecific binding of proteins. Although **M-Histofine** Simple Stain Mouse MAX PO (R) does not require the use of blocking reagent separately, in some cases the application of blocking reagent containing an irrelevant protein, prior to incubation with the primary antibody, may be useful for reducing the background.

10. CONDITION FOR USE

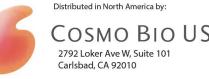

M-Histofine[®] Simple Stain Mouse MAX PO (R) is designed for research use only and is not intended for therapeutic or diagnostic purposes. NICHIREI BIOSCIENCES INC., NICHIREI BIOSCIENCES sales agents and distributors
