Description

The process of expressing the recombinant Human DDAH2 protein includes transfecting e.coli cells with a DNA expression vector carrying the gene for the desired protein (1-285aa). Subsequently, the cells are cultured to induce the expression of the intended protein. The protein is equipped with a N-terminal 6xHis-GST tag. The recombinant Human DDAH2 protein is then collected and purified from the cell lysate through affinity purification, exhibiting a purity exceeding 85%, as verified by SDS-PAGE.

Reconstitution

We recommend that this vial be briefly centrifuged prior to opening to bring the contents to the bottom. Please reconstitute protein in deionized sterile water to a concentration of 0.1-1.0 mg/mL. We recommend to add 5-50% of glycerol (final concentration) and aliquot for long-term storage at -20°C/-80°C. Our default final concentration of glycerol is 50%. Customers could use it as reference.

Shelf Life
