Anti-5-hydroxymethylcytosine (5hmC) pAb

CODE No.	PM077
CLONALITY	Polyclonal
ISOTYPE	Rabbit Ig, affinity purified
QUANTITY	100 μL
SOURCE	Purified IgG from rabbit serum
IMMUNOGEN	BSA-conjugated 5-hydroxymethylcytidine
FORMURATION	PBS containing 50% Glycerol (pH 7.2). No preservative is contained.
STORAGE	This antibody solution is stable for one year from the date of purchase when stored at -20°C.

APPLICATIONS-CONFIRMED

Dot blotting	1:5,000 for chemiluminescence detection system
Hydroxymethylated DNA immunoprecipitation (hMeDIP)	2 μL/sample

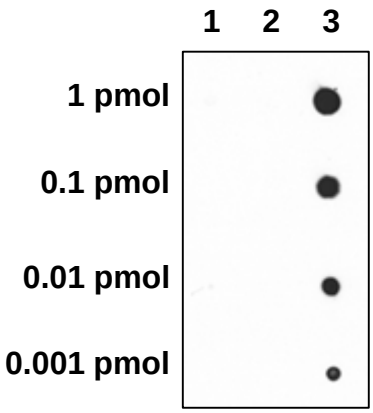
Dot blotting

1) Sample preparation:
   a) Prepare DNA samples by appropriate method (e.g., 5hmC-containing DNA by performing PCR).
   b) Add 0.1 volumes of 1 M NaOH to the DNA samples.
   c) Heat the DNA samples at 99°C for 5 min., then quench at 0°C for 5 min.
   d) Add 0.1 volumes of 6.6 M NH4OAc to the DNA samples.
2) Blot 1 μL of different concentrations of DNA samples onto a nitrocellulose membrane.
3) Cross-link the DNA samples using UV illuminator for 5 min.
4) To reduce nonspecific binding, soak the membrane in 5% skimmed milk (in PBS, pH 7.2) for 1 hr. at room temperature.
5) Wash the membrane with PBS-T [0.05% Tween-20 in PBS] (5 min. x 3 times).
6) Incubate the membrane with primary antibody diluted with 1% skimmed milk (in PBS, pH 7.2) as suggested in the **APPLICATIONS** for 1 hr. at room temperature. (The concentration of antibody will depend on the conditions.)
7) Wash the membrane with PBS-T (5 min. x 3 times).
8) Incubate the membrane with the 1:5,000 Anti-IgG (Rabbit) pAb-HRP (MBL; code no. 458) diluted with 1% skimmed milk (in PBS, pH 7.2) for 1 hr. at room temperature.
9) Wash the membrane with PBS-T (5 min. x 3 times)
10) Wipe excess buffer on the membrane, then incubate it with appropriate chemiluminescence reagent for 1 min. Remove extra reagent from the membrane by dabbing with paper towel, and seal it in plastic wrap.
11) Expose to an X-ray film in a dark room for 5 min. Develop the film as usual. The condition for exposure and development may vary.

(Positive control for Dot blotting; PCR synthesized DNA containing 5hmC)



Dot blot analysis of 5hmC-containing DNA

Lane 1: PCR synthesized DNA containing 114 C residues (414 bp)
Lane 2: PCR synthesized DNA containing 114 5mC residues (414 bp)
Lane 3: PCR synthesized DNA containing 114 5hmC residues (414 bp)

Immunoblotted with Anti-5-hydroxymethylcytosine (5hmC) pAb (PM077)

Hydroxymethylated DNA Immunoprecipitation (hMeDIP)

1) Sample preparation:
   a) Prepare 1 μg of genomic DNA fragment by appropriate method.
   b) Add 50 pg of PCR synthesized C-, 5mC- or 5hmC-containing DNA as a spike-in control.
   c) Dissolve the DNA sample in TE buffer [10 mM Tris-HCl (pH 7.4), 1 mM EDTA] and adjust the volume to 20 μL.
   d) Heat the DNA sample at 99°C for 10 min., then quench at 0°C for 10 min.
2) Add 430 μL of TE buffer, 50 μL of 10 x IP buffer [100 mM Na-Phosphate (pH 7.0), 1.4 M NaCl, 0.5 % Triton X-100] and Anti-5-hydroxymethylcytosine (5hmC) pAb (PM077) as suggested in the **APPLICATIONS** or 2 μg of Normal Rabbit IgG (MBL; code no. PM035). Incubate with gentle agitation for 2 hr. at 4°C.
3) During step 2), wash 40 μL of Dynabeads® M-280 Sheep anti-Rabbit IgG (Life Technologies; code no. 11203D) with 800 μL of PBS and place the tube on the magnetic rack (MBL; Code no. 3190) for a few seconds. Discard the supernatant carefully. Resuspend the beads with 50 μL of 1 x IP buffer [10 mM Na-Phosphate (pH 7.0), 140 mM NaCl, 0.05 % Triton X-100].
4) Add 50 μL of washed beads suspension (prepared in step 3)) to DNA and antibody mixture. Incubate with gentle agitation for 2 hr. at 4°C.
5) Place the tube on the magnetic rack for a few seconds and discard the supernatant carefully.
6) For washing the beads, add 700 μL of 1 x IP buffer and incubate the tube with gentle rotation for 10 min. at room temperature.
7) Place the tube on the magnetic rack for a few seconds and discard the supernatant carefully.
8) Repeat 3 times steps 6)-7).
9) Add 250 μL of Proteinase K digestion buffer [50 mM Tris (pH 8.0), 10 mM EDTA, 0.5 % SDS]. Incubate for 1 hr. at 50°C with inversion every 10 min.
10) Perform DNA extraction by Phenol/Chloroform extraction followed by ethanol precipitation.
11) Dissolve the pellet in 60 μL of nuclease-free water.
