

# VCPIP CD(25-561) [GST-tagged]

## Deconjugating Enzyme

Alternate Names: Valosin-containing protein p97/p47 complex-interacting protein p135, VCPIP135, KIAA1850

Cat. No. 64-0055-050

Lot. No. 30235

Quantity: 50 µg

Storage: -70°C

FOR RESEARCH USE ONLY

NOT FOR USE IN HUMANS

CERTIFICATE OF ANALYSIS Page 1 of 2

### Background

Deconjugating enzymes (DCEs) are proteases that process ubiquitin or ubiquitin-like gene products, reverse the modification of proteins by a single ubiquitin or ubiquitin-like protein (UBL) and remodel polyubiquitin (or poly-UBL) chains on target proteins (Reyes-Turcu *et al.*, 2009). The deubiquitylating – or deubiquitinating – enzymes (DUBs) represent the largest family of DCEs and regulate ubiquitin dependent signalling pathways. The activities of the DUBs include the generation of free ubiquitin from precursor molecules, the recycling of ubiquitin following substrate degradation to maintain cellular ubiquitin homeostasis and the removal of ubiquitin or ubiquitin-like proteins (UBL) modifications through chain editing to rescue proteins from proteasomal degradation or to influence cell signalling events (Komander *et al.*, 2009). There are two main classes of DUB, cysteine proteases and metalloproteases. VCPIP is a cysteine protease and is a member of the OTU superfamily of proteins. Cloning of the human gene was first described by Nagase *et al.* (2001). OTU enzymes play important roles as negative-feedback regulators in NF-κB signalling, interferon signalling and in p97 (cdc48)-mediated processes although the cellular functions of most OTU enzymes remain to be discovered. Ovarian tumour family DUBs contain a papain-like catalytic core of ~180 amino acids. In addition to their catalytic domain, many OTU members have additional ubiquitin-binding domains (UBDs). At least 20 different UBD families have

### Physical Characteristics

**Species:** human

**Source:** *E. coli*

**Quantity:** 50 µg

**Concentration:** 0.5 mg/ml

**Formulation:** 50 mM HEPES pH 7.5,  
150 mM sodium chloride,  
2 mM dithiothreitol, 10% glycerol

**Molecular Weight:** ~87 kDa

**Purity:** >98% by InstantBlue™ SDS-PAGE

**Stability/Storage:** 12 months at -70°C;  
aliquot as required

**Protein Sequence:** Please see page 2

### Quality Assurance

**Purity:**  
4-12% gradient SDS-PAGE  
InstantBlue™ staining  
Lane 1: MW markers  
Lane 2: 1 µg GST-VCPIP

**Protein Identification:**  
Confirmed by mass spectrometry.

**Deubiquitylase Enzyme Assay:**  
The activity of GST-VCPIP was validated by determining the increase in fluorescence measured as a result of the enzyme catalysed cleavage of the fluorogenic substrate Ubiquitin-Rhodamine110-Glycine generating Ubiquitin and Rhodamine110-Glycine. Incubation of the substrate in the presence or absence of GST-VCPIP was compared confirming the deubiquitylating activity of GST-VCPIP.

## Background

Continued from page 1

been described, and knowledge of linkage-specific UBDs have provided the means to understand the roles of different ubiquitin linkages in cells (Licchesi *et al.*, 2012). VCPIP was originally identified as a p97/p47 complex-interacting protein, which binds to the p97/p47/SNARE complex and assists its dissociation via p97-catalysed ATP hydrolysis (Uchiyama *et al.*, 2002). Wang *et al.* (2004) subsequently reported that VCPIP possesses deubiquitylating activity, which is essential for p97/p47-mediated Golgi membrane fusion. The deubiquitylating activity of VCPIP is, however, unnecessary for p97/p37-mediated Golgi membrane fusion, although VCPIP itself is essential in this pathway. VCPIP therefore seems to work in two distinct ways, one via its deubiquitylating activity and the other in a ubiquitin-independent manner, which may be as a p97/p47 (or p37) complex-interacting protein (Uchiyama *et al.*, 2006). VCPIP is a member of the A20-like subfamily; other members include A20, Cezanne, Cezanne2 and TRABID. VCPIP - and OTUD2 - efficiently cleave K11-linked chains and interact with p97, suggesting that p97 may act on substrates containing atypical linkage types, although the role of DUBs in p97 function is not well understood (Mevisen *et al.*, 2013).
