

## TBK1 (human; full length), pAb

Alternate Names: TANK-BINDING Kinase 1; NF-Kappa-B-Activating Kinase; NAK

Cat. No. 68-0053-100  
Lot. No. 30293

Quantity: 100 µg  
Storage: -20°C

FOR RESEARCH USE ONLY

NOT FOR USE IN HUMANS

CERTIFICATE OF ANALYSIS

Page 1 of 2

This antibody was developed and validated by the Medical Research Council Protein Phosphorylation and Ubiquitylation Unit (University of Dundee, Dundee, UK).

### Background

Protein ubiquitylation and protein phosphorylation are the two major mechanisms that regulate the functions of proteins in eukaryotic cells. However, these different posttranslational modifications do not operate independently of one another, but are frequently interlinked to enable biological processes to be controlled in a more complex and sophisticated manner. Studying how protein phosphorylation events control the ubiquitin system and how ubiquitylation regulates protein phosphorylation has become a focal point of the study of cell regulation and human disease. Cloning of human TANK-binding kinase 1 (TBK1) was first described by Pomerantz and Baltimore (1999). TBK1 is an IKK-related kinase, which plays several important roles in the innate immune system. In the MyD88-dependent signalling pathway its activation requires the E3 ubiquitin ligase TRAF6 and the polyubiquitin-binding protein NEMO (Clark *et al.*, 2011a; Clark *et al.*, 2011b). TBK1 interacts with and phosphorylates the NEMO-related protein optineurin (Gleason *et al.*, 2011). TBK1 also plays an essential role in production of type1 interferons that are produced in response to viral double-stranded RNA. This is triggered by the TBK1-catalysed activation of the transcription factor IRF3 (interferon regulatory factor 3) and the E3 ubiquitin ligase

### Physical Characteristics

**Quantity:** 100 µg

**Concentration:** to be provided on shipping

**Source:** sheep polyclonal antibody

**Immunogen:** human TBK1 (residues 1-729) [6His-tagged]

**Purification:** affinity-purified using immobilized immunogen

**Formulation:** phosphate-buffered saline

**Specificity:** detects TBK1 at ~111 kDa

**Reactivity:** human

**Species cross reactivity:** mouse

**Stability/Storage:** 12 months at -20°C; aliquot as required

### Research Applications and Quality Assurance

**Western Immunoblotting:** not tested

**Immunoprecipitation:** use 10 µg/mg of cell extract

#### Immunoprecipitation Assay:

Immunoprecipitation was performed from RAW264.7 macrophage total cell extract (1 mg) using 10 µg of anti-TBK1 antibody (Cat# 68-0053-100) or pre-immune serum (IgG). TBK1 (and TANK) were subsequently detected by Western Blot (WB) using commercially available antibodies.

## Background

Continued from page 1

Pellino 1 (Perry *et al.*, 2004; Smith *et al.*, 2011). TBK1 can be used to activate E3 ubiquitin ligases of the Pellino family *in vitro* (Smith *et al.*, 2011). TBK1 itself contains a ubiquitin-like domain situated next to the kinase catalytic domain which appears to be important for activation of and/or substrate recognition by the protein kinase (Ikeda *et al.*, 2007).

### Antibody Production:

Anti-TBK1 (human) polyclonal antibody was raised in sheep against TBK1 (residues 1-729 of human TBK1). The antibodies were purified by the Medical Research Council Protein Phosphorylation and Ubiquitylation Unit (MRC-PPU, University of Dundee, Dundee, U.K.) by affinity purification of the anti-TBK1 pAbs from the sheep serum using a 6His-tagged antigen-agarose column. Anti-TBK1 (human) pAb was sourced by Ubiquigent directly from the MRC-PPU.
